# Helical Piers

Bartley Corp has a solution for building on unstable soil. We install Grip-Tite® New Construction Helix Piers to help prevent foundation shifting for homes being built on unstable soil. This proven versatile system is available today.

## How does it work?

1. Helical Piers are mechanically screwed into deep stable soil
2. Concrete is poured over the Piers

## Benefits:

- Cost-benefit compared to other old-fashioned deep foundation options
- Concrete can be poured immediately after Helical Piers are installed
- No heavy equipment needed
- Installs quickly without generating spoils
- Modular to meet a variety of soil conditions
- Can be installed in limited access areas
- Installation available during any season
- Out of sight once installation is complete
